*CoolSculpting® is the treatment doctors use most for nonsurgical fat reduction.

Uses

The CoolSculpting® procedure treats visible fat bulges in the inner and outer thighs, abdomen and flank, along with bra fat, back fat, underneath the buttocks (also known as banana roll), upper arm and submental and submandibular areas in patients. The CoolSculpting® procedure is not a treatment for weight loss.

Important Safety Information

The CoolSculpting® procedure is not for everyone. You should not have the CoolSculpting® procedure if you suffer from cryoglobulinemia, cold agglutinin disease, paroxysmal cold hemoglobinuria, areas of impaired peripheral circulation or pregnancy and lactation. Tell your doctor if you have any medical conditions including recent surgery, pre-existing hernia, and any known sensitivities or allergies.

During the procedure you may experience sensations of pulling, tugging, mild pinching, intense cold, tingling, stinging, aching, and cramping at the treatment site. These sensations subside as the area becomes numb. Following the procedure, typical side

effects include temporary redness, swelling, blanching, bruising, firmness, tingling, stinging, tenderness, cramping, aching, itching, or skin sensitivity, and sensation of fullness in the back of the throat after submental or submandibular area treatment. Rare side effects may also occur. CoolSculpting® may cause a visible enlargement in the treated area which may develop two to five months after treatment and requires surgical intervention for correction. Please visit CoolSculpting.ca for full Important Safety Information.
